Semiconductor Innovation Trends in European Patent Filings, Nov 2024 – Sep 2026

Nov 1, 2026 · @fini

1. Executive summary

13,637 semiconductor and quantum applications (12,747 families) entered the European system between 1 Nov 2024 and the data cut-off (EP: 16 Sep 2026). 9,069 are at the EPO: 4,382 filed directly and 4,687 Euro-PCT applications that entered the European phase. 4,568 are at national offices of the 39 EPO member states: 3,648 filed directly and 920 PCT national-phase entries, all at the German office. 41% of the corpus (5,607) comes through the PCT route. The EPO is an international market led by US, Japanese and Korean applicants. The national route, above all the German office, is a European home market led by power-electronics and automotive firms.

Data findings

- **Packaging, not transistors, is the largest field.** Thermal management (1,988), encapsulation (1,795), power-module packaging (1,658), wafer handling and fab equipment (1,622), BEOL interconnects (1,572) and 2.5D/chiplets (1,423) lead. The integration and design domain covers 6,769 applications (50%).
- **Fastest-growing (like-for-like Nov–Aug vs Nov–Aug):** photonic quantum computing +130% (10 → 23), CFET stacked transistors +112% (16 → 34), SRAM +65%, ferroelectric FETs +46% and 2D/carbon-nanotube FETs +42%. Among large categories, 3D stacking/TSV grew 22% and GAA transistors 20%. Deposition (−22%), lithography (−19%) and RF packaging (−33%) fell.
- **Top players.** Samsung (796), Intel (626), Infineon (522), TSMC (352), CEA (326), STMicroelectronics (299), Mitsubishi Electric (294), Bosch (275) and IBM (260). The top five hold 19.2% of filings. Counting the PCT route brings IBM, Huawei (212), Qualcomm (193), Applied Materials (146) and BOE (150) into the top 20.
- **Origin.** By earliest priority claim, the US leads (4,334; 31.8%), ahead of Japan (2,376; 17.4%), Germany (1,418), first filings at the EPO (1,307), Korea (1,218) and China (1,091). By first-named applicant, 33.0% of filings come from EPO member states (4,502; EU27 28.6%): 26.6% at the EPO and 45.8% at national offices.
- **Quantum is half European.** 1,801 quantum applications (13.2% of the corpus, +2%), half of them via PCT (878). 51.6% have a European first-named applicant and 21.4% a university or research institute. Fujitsu leads (161), then Google (79), Microsoft, Pasqal, CEA and Quantinuum (60 each), IBM (57) and IQM (47).

- **Academic weight.** Universities or research institutes appear on 8.5% of filings.
- **The PCT route is a different population.** PCT-route filings over-weight equipment and process steps (wafer cleaning 2.8×, CMP and dicing 2.0×, fab equipment 1.7×) and quantum hardware. Direct filings over-weight leading-edge logic (FinFET 4.5×, GAA 3.3×), because Intel, Samsung and TSMC file directly. Only 17.5% of PCT-route filings have a European first-named applicant, against 43.9% of direct filings.

Main caveats: Euro-PCT applications are dated by their first EP-office record, which appears at entry into the European phase, about 34 months after priority. They therefore describe older inventions (median filing date Nov 2023, against Sep 2024 for direct filings). Italian national data ends in December 2025 and British data thins out in 2026. Direct-only figures (the earlier version of this study) are kept as a variant in sections 9 and 11.

2. Data, scope and corpus

The corpus covers patent applications whose first publication at the EPO or at one of the 39 EPO member-state offices falls between 2024-11-01 and the last available date, and that carry a CPC code in scope. Both filing routes are counted: direct filings, and PCT applications entering the European phase (Euro-PCT) or a national phase. Each application is counted once.

Data freshness (Google Patents Public Datasets, queried 1–8 Nov 2026): latest publication EP 2026-09-16, DE 2026-09-24, GB 2026-09-16, FR 2026-09-04, so August 2026 is the last full month. Italian national records end on 2025-12-21, and British records thin out sharply in 2026. Both are coverage gaps, not drops in filing.

Measure	EP	National offices	All
Applications	9,069 (direct 4,382 · Euro-PCT 4,687)	4,568 (direct 3,648 · PCT national phase 920)	13,637

National application with an EP family member	—	477 (10.4%)	

Filing-date view. The median filing date is 2024-04-30 overall: 2024-10-24 for direct EP, 2023-11-03 for Euro-PCT and 2024-06-03 for national applications. PCT-route filings enter Europe about 31 months after priority, so they describe inventions about a year older than direct filings published in the same window.

Kind codes and route. Direct EP first publications are A1 or A2. A Euro-PCT application appears in the data as an EP A1 (4,407) or A2 (280) record with a PCT number, dated at entry into the European phase (median 34 months after priority, checked against the priority dates). PCT national-phase entries are German DE 11 2… applications, first published as T5 translations (876), B4 (30) or A5 (14). An application counts as PCT route if any of its records carries a PCT number, has an EP A4 supplementary search report, or has a DE 11 2 number. National first publications of direct filings are mostly A1 or A (DE, FR, GB).

Why the scope differs from a legacy H01L study. CPC 2025.01 and 2026.01 moved semiconductor devices to H10D and packaging and processes to the new subclasses **H10W** and **H10P**. No document in the window still carries legacy H01L 21/23/25/27/29. A study with the old code list would miss most of the corpus. Selection is by CPC only, because EPO and European national documents carry CPC; the CN/TW study needed IPC as well (see section 11).

The two comparison windows are ten months each, Nov 2024–Aug 2025 (Y1) and Nov 2025–Aug 2026 (Y2), because the data ends in mid-September 2026.

3. Technology rankings

Packaging and equipment dominate by volume: thermal management, encapsulation, power-module packaging and wafer handling each sit on 12–15% of filings. Counting is **full**: an application counts in every category it matches, so shares add up to more than 100%. Change = like-for-like windows (Nov 2024–Aug 2025 vs Nov 2025–Aug 2026). Baselines: all −2.1% (6,114 → 5,986), EP +1.5% (3,965 → 4,026), national −8.8% (2,149 → 1,960); direct filings −5.0%, PCT route +2.3%. Treat changes on fewer than about 30 applications as indicative only.

Top 22 of 61 categories

Technology	Code basis	Apps	of which PCT	Families	Share	Change	Top 5 applicants (apps)

Not categorised beyond domain level: 579 applications (4.2%), for example those with only electrode or connector codes. Categories 23–61 are in section 4. The full table with the basis of every assignment (CPC only, CPC + text, text only) is in the BigQuery table `patent_study.cats2`.

4. Per-domain breakdown

Domain 1 (transistors, materials, memory and processes) is the largest: 7,960 applications (EP 5,344 · national 2,616 · PCT route 3,170). Domain 2 (integration, packaging and design) is 6,769 (EP 4,227 · national 2,542 · PCT 2,550). Quantum is 1,801 (EP 1,460 · national 341 · PCT 878). Domains overlap: one application can sit in several. EP, national and PCT columns are counts over the whole window; change is like-for-like Y1 → Y2.

Domain 1 — devices, materials, memory and processes (beyond the top table)

Sub-technology	Apps	Change	EP	National	PCT	Leading applicants
IGBT	407	+1%	137	270	165	Infineon 76; Mitsubishi Electric 73; Rohm 29
In-line testing & metrology	407	−1%	263	144	192	Applied Materials 21; Samsung 20; KLA 18
DRAM	387	+29%	341	46	136	Samsung 167; CXMT 45; YMTC 29; Micron 23
3D NAND / flash	351	−3%	282	69	118	Samsung 82; YMTC 66; SanDisk 25

Sub-technology	Apps	Change	EP	National	PCT	Leading applicants
Memory assemblies (HBM, memory–logic stacks)	349	+21%	283	66	98	Samsung 116; Intel 38; YMTC 27
FinFET	348	+13%	178	170	46	TSMC 108; Samsung 80; Intel 66
Power & Schottky diodes	329	−3%	150	179	143	Infineon 33; Mitsubishi Electric 28; STMicroelectronics 26
Oxide semiconductors (IGZO)	320	+18%	183	137	98	LG 75; Samsung 64; Semiconductor Energy Lab 25
Doping (implantation, diffusion)	306	−8%	160	146	131	Infineon 29; Rohm 18; Applied Materials 15
HEMT (GaN / III-V)	306	+5%	235	71	99	STMicroelectronics 36; Samsung 29; Infineon 24
SiGe / Ge	248	+23%	147	101	46	TSMC 69; Samsung 52; Intel 50
ReRAM / phase-change memory	235	−18%	150	85	66	CEA 37; IBM 34; Samsung 32
Lithography & masks (process)	230	−19%	190	40	101	Shin-Etsu 51; Nissan Chemical 19; Merck KGaA 16
ESD & protection structures	228	−27%	148	80	52	Samsung 22; STMicroelectronics 18; Infineon 17
Wafer cleaning	184	+14%	144	40	122	Screen Holdings 19; Applied Materials 11; Sumitomo Electric 10
FeRAM	154	−7%	119	35	58	Samsung 26; CEA 23; Huawei 17
MRAM	135	+2%	90	45	47	IBM 25; Samsung 23; Everspin 10
2D materials (graphene, TMDs)	124	−3%	99	25	40	Samsung 16; CEA 14; Intel 13
SOI / engineered substrates	118	−5%	93	25	46	GlobalFoundries 23; Analog Devices 8; Shin-Etsu 7
SRAM	99	+65%	54	45	24	TSMC 27; Intel 19; Samsung 13
Bipolar transistors / HBT	91	−29%	66	25	25	GlobalFoundries 23; Analog Devices 8; STMicroelectronics 8
Ferroelectric FET (FeFET)	66	+46%	55	11	25	Samsung 16; Merck KGaA 10; Intel 6
CFET (stacked complementary FET)	57	+112%	34	23	14	TSMC 15; imec 11; Intel 10
2D-material & carbon-nanotube FETs	50	+42%	41	9	11	Samsung 14; Intel 6; CEA 6
Diamond	37	+6%	18	19	13	Mitsubishi Electric 5; Soitec 5; CEA 5

Sub-technology	Apps	Change	EP	National	PCT	Leading applicants
Gallium oxide (Ga2O3)	18	12 → 6	7	11	12	TDK 4; Bosch 3; Novel Crystal Technology 2

Transistor filings split into two groups with almost no overlap in applicants. **Advanced logic** (GAA 826, FinFET 348, CFET 57) is held by Intel, Samsung and TSMC, with IBM fourth in GAA (73, mostly via PCT); the three file 569 of the 826 GAA applications, almost all directly. **Power devices** (power MOSFET 626, IGBT 407, diodes 329, HEMT 306) are held by European and Japanese firms: Infineon leads power MOSFETs (123) and IGBTs (76), followed by Mitsubishi Electric, Rohm, Fuji Electric and MinebeaMitsumi, which enter Germany through the PCT national phase. Display TFTs (724) are an East Asian field: Samsung, LG and BOE hold 461.

Material platforms, by count: SiC 557 > GaN 431 > oxide 320 > SiGe 248 > 2D 124 > diamond 37 > Ga2O3 18. Memory is led by Samsung (43% of DRAM), but the PCT route adds CXMT, YMTC and Micron; Europe's role is in emerging memories (CEA leads ReRAM/PCM and is second in FeRAM). Process filings are led by suppliers, most of them via PCT: Applied Materials, Screen, ASML, Naura and Kokusai in equipment; Shin-Etsu, Nissan Chemical and Merck in lithography materials; Soitec in wafer preparation.

Domain 2 — integration, packaging and design

Sub-technology	Apps	Change	EP	National	PCT	Leading applicants
Power-module & discrete packaging	1,658	−8%	879	779	538	Infineon 160; Mitsubishi Electric 89; Nexperia 70; Intel 67
2.5D, chiplets, interposers & RDL	1,423	+1%	939	484	535	Intel 192; Qualcomm 89; Samsung 70; Infineon 60
3D chip stacking & TSV	964	+22%	693	271	350	Intel 174; Samsung 83; Qualcomm 59; TSMC 57
Hybrid / direct bonding	681	+11%	474	207	268	Intel 76; Samsung 66; Soitec 58; Adeia 53; CEA 45
RF / impedance matching in packages	469	−33%	330	139	185	NXP 39; Intel 33; Qualcomm 30
Monolithic 3D integration	332	+11%	225	107	71	Samsung 73; Intel 52; TSMC 47; IBM 33; imec 29
Glass & ceramic package substrates	314	+15%	217	97	106	Intel 97; Absolics 38; BorgWarner 24
IC layout & physical design (EDA)	258	−23%	198	60	108	Samsung 24; Intel 16; TSMC 14; Siemens EDA 11
Standard-cell / device layout & routing	244	+14%	164	80	60	Samsung 65; TSMC 40; Intel 28; Qualcomm 23

Sub-technology	Apps	Change	EP	National	PCT	Leading applicants
Backside power delivery	237	−21%	193	44	70	Samsung 67; Intel 63; IBM 52
Fan-out & wafer/panel-level packaging	24	6 → 13	21	3	9	Silicon Box 5; Infineon 2; Samsung 2

The domain has two halves. Automotive and power packaging (thermal, encapsulation, power modules) is led by Infineon, Bosch, ZF, Nexperia, Volkswagen and the Japanese power firms. Advanced logic packaging (chiplets, 3D stacking, hybrid bonding, glass substrates) is led by Intel, Samsung, TSMC and, via PCT, Qualcomm and Adeia; Europe's visible contributors are Soitec, CEA and imec. Fan-out packaging has no own CPC group and is found by keyword only, so it is almost certainly undercounted.

Domain 3 — quantum

Sub-technology	Apps	Change	EP	National	PCT	Leading applicants
Processor architecture & qubit control	1,114	−7%	915	199	613	Fujitsu 65; Google 58; Quantinuum 53; IBM 47; Pasqal 47
Algorithms & software	917	+10%	792	125	439	Fujitsu 108; Google 50; Microsoft 37; Pasqal 37
Error correction	410	+32%	347	63	204	Google 44; Fujitsu 38; Microsoft 32; Alice & Bob 28; Riverlane 19
Superconducting qubits (incl. cat qubits)	376	−13%	310	66	204	Fujitsu 40; Alice & Bob 28; IBM 24; CEA 22; Northrop Grumman 17
Semiconductor spin qubits / quantum dots	152	−32%	107	45	69	CEA 38; TU Delft 19; FZ Jülich 11; RWTH Aachen 7; Silicon Quantum Computing 7
Trapped-ion	74	−36%	55	19	29	eleQtron 22; Infineon 20; Quantinuum 9; IonQ 6
Photonic quantum computing	38	+130%	25	13	13	SaxonQ 4; ORCA Computing 4; PsiQuantum 4; Quandela 3
Neutral atoms	34	+20%	32	2	20	Pasqal 10; Max Planck Society 5; LMU Munich 4; Harvard 4
Topological / Majorana	22	9 → 12	19	3	14	Microsoft 14; TU Delft 5

The quantum domain (1,801) grew 2% (778 → 795), and half of it (878) comes via PCT. Counting the PCT route adds the US quantum companies: Google (79), Microsoft (60), Quantinuum (60), IBM (57), PsiQuantum (29), IonQ and Rigetti. Platform counts depend on title and abstract keywords (searched in English, German and French), because CPC has platform groups only for superconducting (H10N60) and spin-qubit devices.

Extensions

Not queried in the EP study. The CN/TW study reports quantum communication and sensing (QKD, magnetometry, atomic clocks) and equipment (lithography tools, CVD/ALD, plasma equipment) as separate extension sets. Here, wafer handling and fab equipment (H10P72, 1,622) is the only equipment category, and it sits in the core scope.

5. Top applicants

Concentration is moderate overall and high at national offices. The top 5 groups hold 19.2% of all filings (2,622 of 13,637: Samsung, Intel, Infineon, TSMC, CEA). At the EPO the top 5 hold 19.3% (Samsung 794, Intel 379, Huawei 212, Qualcomm 193, NXP 169); at national offices 33.1% (Infineon 385, TSMC 352, Mitsubishi Electric 284, Intel 247, Bosch 245). The PCT route is the least concentrated (14.0%: IBM 195, Qualcomm 188, Huawei 169, Applied Materials 131, Mitsubishi Electric 103). Applicants are grouped under parents (rules in section 11). Change = like-for-like windows; compare against the baseline (−2.1%).

Top 20

#	Applicant (parent)	Type	Country	Apps	of which PCT	Y1 → Y2	Technology profile (top 3)
1	Samsung (Electronics, Display, Electro-Mechanics)	company	KR	796	76	379 → 339 (−11%)	GAA; TFT; DRAM
2	Intel	company	US	626	73	225 → 328 (+46%)	GAA; 2.5D/chiplets; 3D stacking/TSV
3	Infineon (all entities)	company	DE	522	14	230 → 227 (−1%)	power-module packaging; power MOSFET; IGBT
4	TSMC	company	TW	352	0	175 → 171 (−2%)	GAA; FinFET; SiGe
5	CEA	research institute	FR	326	38	158 → 142 (−10%)	hybrid bonding; deposition; spin qubits
6	STMicroelectronics	company	CH	299	1	150 → 115 (−23%)	power-module packaging; GaN; HEMT
7	Mitsubishi Electric	company	JP	294	103	126 → 140 (+11%)	power-module packaging; IGBT; power MOSFET

#	Applicant (parent)	Type	Country	Apps	of which PCT	Y1 → Y2	Technology profile (top 3)
8	Bosch	company	DE	275	28	130 → 106 (−18%)	power-module packaging; power MOSFET; 2.5D/chiplets
9	IBM	company	US	260	195	169 → 67 (−60%)	GAA; backside power; qubit control
10	Huawei	company	CN	212	169	95 → 96 (+1%)	2.5D/chiplets; power-module packaging; 3D stacking/TSV
11	LG (Display, Electronics, Innotek)	company	KR	211	48	102 → 95 (−7%)	TFT; oxide semiconductors; 2.5D/chiplets
12	Qualcomm	company	US	193	188	66 → 113 (+71%)	2.5D/chiplets; 3D stacking/TSV; integrated passives
13	NXP	company	NL	169	0	90 → 70 (−22%)	power-module packaging; 2.5D/chiplets; RF packaging
14	Fujitsu	company	JP	165	64	42 → 96 (+129%)	quantum algorithms; qubit control; superconducting qubits
15	Soitec	company	FR	157	64	69 → 53 (−23%)	hybrid bonding; deposition; SiC
15	Nexperia	company	NL	157	3	64 → 83 (+30%)	power-module packaging; power MOSFET; 2.5D/chiplets
17	Shin-Etsu (incl. Shin-Etsu Handotai)	company	JP	155	89	81 → 61 (−25%)	deposition; lithography/masks; etching
18	BOE	company	CN	150	100	80 → 62 (−22%)	TFT; oxide semiconductors; ESD
19	Applied Materials	company	US	146	131	79 → 49 (−38%)	wafer handling; deposition; etching
20	imec	research institute	BE	136	7	65 → 53 (−18%)	GAA; monolithic 3D; etching

Next five: onsemi (US) 110 (+89%), ZF Friedrichshafen (DE) 110 (−62%), Google (US) 102 (+23%), Texas Instruments (US) 100 (−30%), YMTC (CN) 100 (−15%).

Eight of the top 20 are European, including two research institutes (CEA, imec). The profile excludes the five catch-all categories (CMOS integration, BEOL, thermal, encapsulation, other wafer processes). Applicants split clearly by route: TSMC, NXP, STMicroelectronics, Infineon and Nexperia file almost only directly, while IBM (75% PCT), Huawei (80%), Qualcomm (97%), Applied Materials (90%) and BOE (67%) enter mainly via PCT. Mitsubishi Electric uses both, including 95 German national-phase entries. STMicroelectronics (230 families) and CEA (218) have notably fewer families than applications because they file the same invention at a national office and at the EPO.

Applicant types (share of filings with at least one applicant of that type):

Type	Apps	Share
Company	12,461	91.4%
University	436	3.2%
Research institute	819	6.0%
University or institute	1,153	8.5%
Individual or unclassified (no company suffix)	306	2.2%

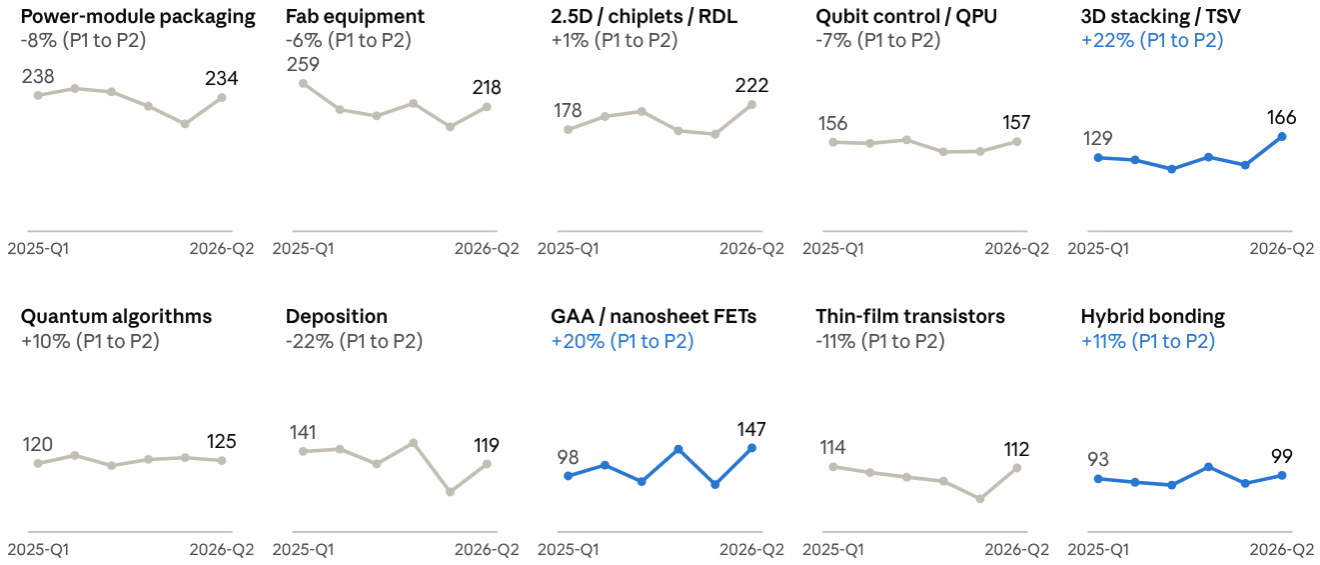

Universities or institutes appear on 8.5% of EP and of national filings, on 9.8% of direct filings and on 6.5% of PCT-route filings. In quantum the academic share is 21.4% (385 of 1,801).

6. Quarterly time series

Volume is flat at about 1,550–2,000 applications per complete quarter through Q2 2026. Euro-PCT entries are steady (535–692 a quarter); national direct filings drift down. Among the ten largest specific technologies, 3D stacking/TSV (+22%) and GAA transistors (+20%) rose most, both with a jump in Q2 2026.

3D stacking and GAA transistors grow fastest among the ten largest technologies

Applications per complete quarter incl. PCT route, Q1 2025 to Q2 2026, same scale. Blue: up >10% P1 to P2.

Google Patents Public Datasets (BigQuery), queried 8 Nov 2026 · direct and PCT-route applications, complete quarters Q1 2025 – Q2 2026 · change = Nov–Aug vs Nov–Aug

The publication-lag boundary is the last complete month, August 2026; Q4 2024 covers only November and December, and Q3 2026 only July to mid-September. Both partial quarters are left out of the chart. Italian data stops after December 2025 and British data thins in 2026, which depresses national counts from 2026 on.

Applications by quarter and route (incomplete quarters in brackets):

Route	[24-Q4]	25-Q1	25-Q2	25-Q3	25-Q4	26-Q1	26-Q2	[26-Q3]

All	**957**	**1,900**	**2,000**	**1,815**	**1,908**	**1,546**	**1,991**	**1,520**

Top 10 technologies by quarter:

Technology	[24-Q4]	25-Q1	25-Q2	25-Q3	25-Q4	26-Q1	26-Q2	[26-Q3]
Thermal management	131	263	318	302	264	231	280	199
Encapsulation	126	280	278	228	255	204	229	195
Power-module packaging	111	238	250	244	219	188	234	174
Wafer handling & equipment	124	259	213	202	224	183	218	199
BEOL interconnect	126	234	222	194	223	162	250	161

Technology	[24-Q4]	25-Q1	25-Q2	25-Q3	25-Q4	26-Q1	26-Q2	[26-Q3]
2.5D / chiplets	102	178	201	210	176	170	222	164
Quantum processor & control	79	156	154	160	139	140	157	129
CMOS integration	68	148	146	131	190	109	182	124
3D stacking / TSV	57	129	125	109	130	116	166	132
Quantum algorithms	51	120	134	116	127	130	125	114

Quarterly counts swing by up to a third (EP publication batches), so single quarters say little. The Euro-PCT row is the steadiest, because European-phase entry follows a fixed 31-month deadline. The decline in process categories (deposition, lithography, doping) may partly be a classification effect: H10P only came into force with CPC 2026.01, and recently published documents may not yet carry their final H10P codes. Read those drops as provisional until a later re-run confirms them.

7. Origin of filings

The EPO is an international market: about three quarters of EP filings (73.4%) come from applicants outside the EPO states. The national offices are a European home market: 45.8% of their filings have a European first-named applicant, most of them German, with Japanese power firms entering through the German national phase.

a) Priority office (earliest priority claim, data-derived)

Every application in the corpus carries at least one priority claim.

Priority office	All	At EP	At national offices	of which PCT route
United States	4,334 (31.8%)	3,199	1,135	2,054
Japan	2,376 (17.4%)	1,462	914	1,630
Germany	1,418 (10.4%)	220	1,198	185
EPO (first filing at the EPO)	1,307 (9.6%)	1,264	43	304
South Korea	1,218 (8.9%)	1,048	170	218
Mainland China	1,091 (8.0%)	956	135	746
France	748 (5.5%)	296	452	128

Priority office	All	At EP	At national offices	of which PCT route
United Kingdom	265	150	115	106
Netherlands	174	63	111	37
Italy	171	94	77	14
Finland	125	73	52	59
Taiwan	116	64	52	0
India, Sweden, Austria, Australia	63, 61, 26, 22			

Most Japanese (1,630 of 2,376) and Chinese (746 of 1,091) first filings reach Europe via PCT, so both countries count about three times as much as in a direct-only view. Many Taiwanese applicants (TSMC above all) claim **US first filings**: Taiwanese applicants file 583 applications, but only 116 carry a TW priority. German first filings stay national: 1,198 national applications claim a German priority, against 220 EP applications.

b) Filing route

41% of the corpus (5,607) comes through the PCT route: 4,687 Euro-PCT applications at the EPO and 920 national-phase entries at the German office. The share of the EP route that goes via PCT depends strongly on where the applicant comes from:

First-named applicant country	EP filings	of which Euro-PCT
United States	2,636	1,679 (64%)
Japan	1,522	1,090 (72%)
South Korea	1,150	212 (18%)
Mainland China	889	656 (74%)
Germany	601	289 (48%)
France	387	162 (42%)
Netherlands	383	96 (25%)
Switzerland	251	24 (10%)
United Kingdom	168	115 (68%)
Taiwan	158	14 (9%)

The German national phase is used mainly by Japanese applicants (579 of 920; Mitsubishi Electric 95, Rohm 73, Fuji Electric 59, MinebeaMitsumi 54) and US applicants (195, IBM 57). Only 477 national applications (10.4%) belong to families that also have an EP member in the data. By applicant: Samsung (719 of 796), NXP, imec and GlobalFoundries file almost only directly at the EPO; TSMC (all 352), Bosch (245 of 275) and Renesas file almost only at the German office; Qualcomm, Huawei, Applied Materials, IBM, CXMT and Quantinuum enter almost only via Euro-PCT.

c) Europe

Applicants from EPO member states file 4,502 applications (33.0%, first-named applicant), of which EU27 3,897 (28.6%). By route: 26.6% at the EPO, 45.8% at national offices; 43.9% of direct filings but only 17.5% of PCT-route filings. The largest European applicants are Infineon 500, CEA 319, Bosch 275, STMicroelectronics 248, Soitec 157, Nexperia 156, imec 135, ZF 110, ASML 80 and Siemens 75. In quantum, 51.6% of filings (929 of 1,801) have a European first-named applicant. 241 records carry no applicant country.

d) Applicant origin by route

First-named applicant country	At EP	At national offices	All
United States	2,636	585	3,221
Japan	1,522	937	2,459

First-named applicant country	At EP	At national offices	All
Germany	601	1,178	1,779
South Korea	1,150	153	1,303
Mainland China	889	112	1,001
France	387	339	726
Taiwan	158	425	583
Netherlands	383	105	488
Switzerland	251	134	385
Austria	150	145	295
United Kingdom	168	38	206
EPO member states	**2,409 (26.6%)**	**2,093 (45.8%)**	**4,502 (33.0%)**

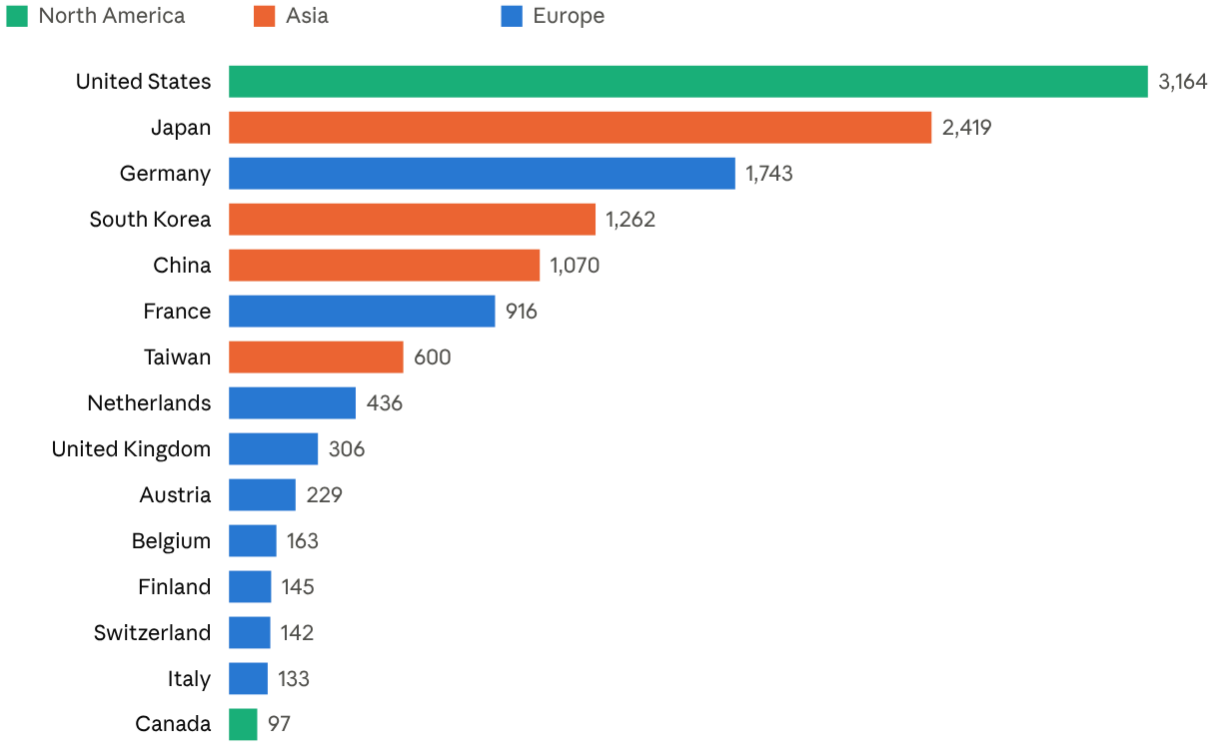

Korean and Chinese applicants enter Europe almost only through the EPO; Taiwanese applicants mostly through the German office (TSMC). Family links run deeper than direct filings: 65.6% of the corpus belongs to families that also have a CN member and 29.6% a TW member (section 2).

e) Inventor countries

Inventor countries come from Google's harmonised inventor data and are known for 13,483 of the 13,637 applications; Italian national filings carry no inventor data. By inventor location, Europe contributes 33.4% of the corpus (4,499 applications, fractional count), Asia 41.5% (5,592) and North America 24.2% (3,262). That is almost exactly Europe's applicant share (33.0%): European inventors and European applicants largely coincide. On direct filings alone Europe's inventor share is 44.8%; on PCT-route filings 17.2%.

US and Japanese inventors are named most often; Europe supplies a third of inventor input

Applications by inventor country, fractional count (an application with two inventors in two countries counts 0.5 each)

Google Patents Public Datasets (BigQuery), inventor_harmonized country codes, queried 8 Nov 2026 · 13,483 of 13,637 applications with inventor data · top 15 countries

Research is regional, not global. Only 598 applications (4.4%) name inventors from more than one world region; 4,305 are purely European, 5,403 purely Asian and 3,070 purely North American. Of the 4,689 applications with at least one European inventor, 4,260 (91%) have a European first-named applicant, 282 a North American and 104 an Asian one.

Share of inventor input by domain and technology (fractional, rows may not add to 100% because of rounding and other regions):

Domain / technology	Applications	Europe	Asia	N. America	of which DE	FR	AT
Quantum (domain)	1,771	53%	16%	28%	17%	11%	2%
Processes and equipment (domain)	3,672	33%	46%	20%	10%	9%	2%
Integration and packaging (domain)	6,447	32%	41%	26%	15%	6%	2%

Inside the companies: where their inventors are (fractional share of each group's inventor input):

Applicant	Applications with inventor data	Inventor countries
Infineon	521	Germany 57% · Austria 25% · Malaysia 8% · Canada 3% · USA 3%
STMicroelectronics	250	France 57% · Italy 31% · Singapore 3% (Italian filings lack inventor data)
NXP	169	Netherlands 91% · France 7%
Nexperia	157	UK 31% · Germany 23% · China 16% · Netherlands 11% · Hong Kong 11%
Bosch	275	Germany 93% · Hungary 3%
GlobalFoundries	96	USA 61% · Germany 14% · Singapore 13% · India 9%
Huawei	212	China 80% · Germany 17% · Belgium 2%

Applicant	Applications with inventor data	Inventor countries
Texas Instruments	100	USA 71% · Japan 7% · Germany 6% · Philippines 6%
onsemi	110	USA 35% · Korea 18% · China 13% · Malaysia 5%
Applied Materials	146	USA 84% · Israel 5% · Singapore 4%
IBM	259	USA 92% · Switzerland 3% · Japan 2%
Intel	626	USA 93% · Germany 2%
Qualcomm	193	USA 100%
Samsung	796	Korea 87% · USA 13%
Mitsubishi Electric	294	Japan 98%
TSMC	352	Taiwan 100%

Austria. 314 applications name at least one inventor in Austria. Infineon accounts for 197 of them (63%), followed by AT&S (21), EV Group (17), TDK Electronics (13), Miba Sinter (8) and the University of Innsbruck (5). Infineon's Austrian-invented applications centre on power semiconductors: power MOSFETs 85, SiC 50, IGBTs 45, power-module packaging 23, doping processes 22. They also include quantum work: qubit control 22 and trapped-ion 14. Of the 197, 100 were filed by Infineon Technologies Austria AG and 96 by the German parent, so counting by applicant entity alone would hide half of the Austrian output. 188 of the 197 were filed directly.

City level (e.g. Villach) is not in this dataset, which records only the inventor's country. The EPO Register has published each inventor's place of residence (city and postcode) since November 2021 (OJ EPO 2021, A12). For the EP applications, a Villach count is therefore possible as a second step. Note that it measures where inventors live, not where they work: Villach-site staff living in Klagenfurt would not show up as Villach.

f) Applicant locations by city (verified, direct filings)

Unlike the CN regions in the CN/TW study, which are inferred from the headquarters of the top 50 applicants, applicant locations here are verified per filing entity (Wikidata headquarters, USPTO applicant addresses re-geocoded against Overture Maps, and manual checks of registers and company websites; method in section 11). The located unit is the applicant entity on the filing, so a subsidiary sits at its own address: Infineon Technologies Austria AG in Villach, Infineon Technologies AG in Neubiberg. **This table**

covers the 8,062 direct filings only. The interactive atlas now also locates the applicants that enter via PCT (e.g. Qualcomm in San Diego, Huawei in Shenzhen, Applied Materials in Santa Clara) and has a filter for the filing route. Counts are applications per filing-entity city (full count).

City	Apps	Main applicants
Suwon (KR)	628	Samsung
Santa Clara (US)	583	Intel
Tokyo (JP)	512	Mitsubishi Electric, Fujitsu, Renesas, Kokusai Electric
Hsinchu (TW)	453	TSMC, MediaTek, UMC (incl. 83 recorded as "Hsinchu City")
Paris (FR)	375	CEA, CNRS, Alice & Bob
Plan-les-Ouates (CH)	295	STMicroelectronics
Neubiberg (DE)	295	Infineon
Gerlingen (DE)	247	Bosch
Seoul (KR)	240	LG, Hyundai
Villach (AT)	185	Infineon Technologies Austria
Nijmegen (NL)	165	Nexperia
Leuven (BE)	145	imec
Munich (DE)	127	
Singapore (SG)	123	
Friedrichshafen (DE)	110	ZF
Austin (US)	100	NXP (US entity)
Bernin (FR)	93	Soitec
Yongin (KR)	93	
Malta, NY (US)	83	GlobalFoundries
Eindhoven (NL)	72	
Armonk (US)	67	IBM

The interactive atlas shows all located applicants on a map, with sources and precision per record. About 40% of institutional filing entities, holding about 10% of applicant mentions, could not be located below country level; they are not placed at a national centroid. Private inventors are kept at country level, and no residential information was searched.

8. Emerging technologies

The logic generation after GAA (CFET, SRAM, ferroelectric and 2D-channel FETs) and photonic quantum computing are the fastest-growing fronts. Rule (as in the CN/TW study, with a threshold adapted to the smaller corpus): at least +40% like-for-like and at least 20 applications in the later window.

Technology	Y1 → Y2	Change	Example publications (later window)
Photonic quantum computing	10 → 23	+130%	EP4655724A1 (ORCA Computing, Euro-PCT); EP4789143A2 (PsiQuantum, Euro-PCT); EP4760606A1 (Quandela)
CFET (stacked complementary FET)	16 → 34	+112%	DE102025118029A1 (TSMC); EP4781807A1 (Qualcomm, Euro-PCT); EP4793814A1 (imec)
SRAM	34 → 56	+65%	DE102025149977A1 (TSMC); DE102025147699A1 memory architectures with backside metal-zero bit lines (Intel); EP4770329A2 (Samsung)
Ferroelectric FET (FeFET)	24 → 35	+46%	EP4759092A1 (Merck KGaA, Euro-PCT); EP4646734A1 (University of Michigan, Euro-PCT); EP4658016A1 (Samsung)
2D-material & carbon-nanotube FETs	19 → 27	+42%	EP4780161A1 (Samsung); EP4681247A1 (Paragraf, Euro-PCT); FR3166241A1 (CEA)

Just below the +40% bar: quantum error correction 151 → 199 (+32%), DRAM 153 → 198 (+29%), SiGe 104 → 128 (+23%), 3D stacking/TSV 388 → 474 (+22%) and HBM-type memory assemblies 138 → 167 (+21%). Very small bases: fan-out packaging 6 → 13, topological qubits 9 → 12. Glass and ceramic package substrates grew 56% in direct filings (Intel, Absolics) but only 15% overall (133 → 153), because PCT-route glass-substrate filings fell; the direct-only signal was an Intel effect. Backside power delivery fell 21%.

New applicants (none in the earlier window, at least 6 in the later one). This is new *within the study window*, since earlier history was not queried.

- Musco Corp (US, 12), Yamaha Robotics (JP, 11), Nvidia (US, 7), Aehr Test Systems (US, 7), Nu Quantum (GB, 7), Niterra Materials (JP, 7), Bitdeer Semiconductor (SG, 7), Guangzhou CSOT (CN, 6), Ampere SAS (FR, 6), Yield Engineering Systems (US, 6).

Fastest-rising title terms: not used. Titles in this corpus are in German, French and English (national offices publish in their own language), so bigram counts mostly reflect the language mix ("und herstellungsverfahren", "un dispositif") rather than technology. This is the same reason the CN/TW study did not use the TW `top_terms`.

9. EP vs national comparison, and direct vs PCT route

The two offices show opposite profiles. EP filings over-weight memory, quantum and leading-edge logic: DRAM 3.7×, quantum algorithms 3.2×, quantum error correction 2.8×, FeFET 2.5×, lithography and masks 2.4×, superconducting qubits 2.4×, qubit control 2.3×, backside power 2.2× and HBM-type assemblies 2.2× (share among EP filings ÷ share among national filings; categories with at least 60 applications). National filings over-weight power electronics: IGBT 3.8×, power MOSFET and power diodes 2.4×, FinFET 1.9×, doping 1.8×, power-module packaging 1.8× and SiC 1.7×. This is the agenda of the German power and automotive industry, plus TSMC and the Japanese power firms that use the German office.

The two routes differ just as much. PCT-route filings over-weight process steps and quantum hardware: wafer cleaning 2.8×, CMP and dicing 2.0×, qubit control 1.8×, fab equipment 1.7×, superconducting qubits 1.7×, wafer preparation 1.6×. Direct filings over-weight leading-edge logic: FinFET 4.5×, GAA 3.3×, SiGe 3.0×, monolithic 3D 2.6×, CMOS integration 2.4×.

Structural indicator	EP	National offices	Direct (all offices)	PCT route (all offices)
Applications / families	9,069 / 8,812	4,568 / 4,397	8,030 / 7,530	5,607 / 5,493
Top-5 applicant concentration	19.3%	33.1%	30.3%	14.0%
European first-named applicant	26.6%	45.8%	43.9%	17.5%
European share of inventor input	27.5%	45.5%	44.8%	17.2%

Structural indicator	EP	National offices	Direct (all offices)	PCT route (all offices)
University or research institute involved	8.5%	8.5%	9.8%	6.5%
Quantum intensity (quantum domain share)	16.1% (1,460)	7.5% (341)	11.5% (923)	15.7% (878)
Advanced packaging (2.5D/chiplets + 3D stacking + hybrid bonding, Y1 → Y2)	603 → 654 (+8%)	299 → 313 (+5%)	550 → 596 (+8%)	352 → 371 (+5%)
Power-module packaging (Y1 → Y2)	421 → 359 (−15%)	351 → 353 (+1%)	496 → 504 (+2%)	276 → 208 (−25%)
Family also at US / JP / KR / CN	90.9%	72.7%	77.8%	94.8%
Median filing date	2024-04-12	2024-06-03	2024-09-19	2023-10-31
Overall volume change (like-for-like)	+1.5%	−8.8% (partly coverage gaps in IT and GB)	−5.0%	+2.3%

Direct-only variant. The direct column reproduces the earlier version of this study (8,062 applications), except that 32 German DE 11 2 applications, previously counted as direct, are now recognised as PCT national-phase entries. Its rankings are those of applicants who file directly in Europe.

The EP study and the CN/TW study are kept separate. Both now count PCT-route filings and also report a PCT-excluded variant, so they can be read side by side on the structural indicators, which use the same definitions; technology categories differ (61 here, 65 there) and would need a mapping.

10. Interpretation (not data)

This section reads the patterns above. Patent counts measure filing behaviour, not capability, and short windows are noisy.

Logic and power are two separate industries. Europe has no own player in leading-edge logic transistors: imec and CEA are the only European names among the top GAA filers, and both are research institutes. In power semiconductors Europe leads: Infineon, STMicroelectronics, Nexperia and Bosch are among the main filers in every power

category, now joined by Japanese firms (Mitsubishi Electric, Rohm, Fuji Electric, MinebeaMitsumi) once their PCT national-phase entries are counted. European inventors still contribute 38–48% of the inventor input in SiC, GaN, power MOSFETs and power-module packaging.

Two ways into Europe. Korean, Taiwanese, Swiss and Dutch applicants file directly; US, Japanese, Chinese and British applicants mostly enter via PCT. Many equipment, materials and quantum companies file mainly via PCT (Applied Materials 90% of its filings, Entegris, Merck KGaA, Quantinuum 98%, Google 70%). A direct-only count therefore measures who chooses the direct route as much as who invents, which is why the earlier version showed Samsung and the European power firms so prominently.

The German office as a second European route. TSMC, Bosch and Renesas file almost exclusively at the German office, and Japanese power firms enter Germany via the PCT national phase rather than the EPO. A DE filing is cheaper and becomes a German patent faster, and Germany is the largest market for automotive power electronics. For these applicants, the German office looks like the main European route rather than a step towards the EPO.

Advanced packaging grows on every route. Chiplets, 3D stacking and hybrid bonding grew 5–8% on every route, with Qualcomm and Adeia adding to Intel, Samsung and TSMC. Glass substrates turned out to be an Intel effect in direct filings rather than a broad trend. Europe's contribution to advanced packaging comes through wafer bonding and 3D-integration research (Soitec, CEA, imec) rather than through packaging companies.

Quantum: European start-ups and US platforms. Quantum is the domain with the highest European share of inventor input (53%; 52% of filings have a European first-named applicant), but counting the PCT route shows the US platforms: Google, Microsoft, Quantinuum, IBM, PsiQuantum, IonQ. Error correction rising (+32%) while qubit-hardware filings fall (−7%) fits a field moving towards fault-tolerant architectures. The fall in trapped-ion filings (−36%) holds even with Quantinuum counted, so it is not only a filing-route effect, as the direct-only version suggested.

Memory is a Samsung field, with Chinese challengers. Samsung files 43% of DRAM applications, almost all directly. The PCT route adds CXMT (45 DRAM), YMTC (66 3D NAND) and Micron. Europe's memory role is in emerging memories (CEA, STMicroelectronics).

Next-node preparation. The cluster of CFET, SRAM, FeFET and cell-layout filings by TSMC, Intel, Samsung and imec looks like early preparation for nodes beyond the first GAA generation. Backside power delivery fell 21%; its main filing wave may already lie before this window.

Austria and Villach. 314 applications name an Austrian inventor and Infineon accounts for 63% of them, centred on power semiconductors and also trapped-ion and qubit-control work. Among direct filings, Infineon Technologies Austria AG in Villach is the tenth-largest applicant location (185 applications), which makes Villach one of Europe's main semiconductor invention sites by this measure.

Implications for Europe. European applicants hold a third of filings in their own market (33%), the same as Europe's share of inventor input (33%), and 44% of direct filings. Their strength is in power electronics, automotive packaging, process research and quantum, and they are largely absent from leading-edge logic, memory, advanced packaging and equipment outside lithography (ASML). This mirrors the CN/TW study, where European applicants appear mainly in lithography, materials and power semiconductors.

Other readings exist. The decline in process categories may be a CPC reclassification effect (H10P from 2026.01) rather than less process research. The national-route decline is partly a coverage gap (IT, GB). Euro-PCT applications describe inventions about a year older than direct filings, so a mix of routes also mixes invention vintages. And IBM's fall (−60%) or Intel's rise (+46%) may reflect changes in filing strategy rather than in invention.

11. Methodology appendix

All numbers come from the Google Patents Public Datasets on BigQuery (`patents-public-data.patents.publications`), run in project `patent-study-513418` , dataset `patent_study` .

Queries and bytes processed (public tables)

Step	Table built	Bytes
Corpus builds, direct filings only (first run missed H10W/H10P, redone)	`corpus` , `apps_final`	≈ 527 GB
Categories, applicant grouping, inventor countries, application list (direct)	`rules` , `cats` , `appl` , `inv` , `inv_app` , `application_list`	≈ 83 GB
Family jurisdictions (direct) and earliest priority claims (direct)	`fam_jur` , `prio`	12.6 GB
Route check: kind codes and PCT flags at European offices	—	16.7 GB

Step	Table built	Bytes
Corpus build incl. PCT route, with inventors and priority claims	`corpus2`	278 GB
Categories, applicant grouping, inventors for the full corpus	`apps2`, `apps_final2`, `cats2`, `appl2`, `inv2`, `inv_app2`	0.2 GB
Family jurisdictions (full corpus)	`fam_jur2`	2.4 GB
Applicant locations (Wikidata, PatentsView, Overture Maps; direct filers)	`ent_loc2`, `ent_loc3`, `gaz`, `pv_geo`, `loc_export`, `map_export`	not itemised
Total, study tables		**≈ 920 GB** plus location lookups

The PCT rebuild (8 Nov) billed about 300 GB, roughly $1.90 at on-demand pricing ($6.25/TB), because the project had already used its free 1 TB this month. Tables in a sandbox expire 60 days after creation: export them before about early January 2027 (in the console: query the table, then Save results → CSV or Google Drive).

Corpus definition

- **Unit:** application (first publication only; later publications of the same application merged), plus distinct DOCDB `family_id`.
- **Offices:** EP plus the 39 EPO member states.
- **Window:** first publication at a European office 2024-11-01 to 2026-10-31. Effective end: EP 2026-09-16, DE 2026-09-24; IT 2025-12-21.
- **Core scope (CPC, any position):** `^(H10D|H10B|H10W|H10P|H10N60/|H01L(21|23|25|27|29)/|G06N10/|B82Y10/|G06F30/39)`, with B82Y10 counted only together with a quantum keyword. Legacy H01L is matched but carries no document in the window.
- **Route:** an application is PCT route if any of its records carries a PCT number, it has an EP A4 supplementary search report, or it has a German DE 11 2 national-phase number. Euro-PCT applications are dated by their first EP-office record (A1 or A2), which Google Patents dates at entry into the European phase; PCT national-phase entries by their first DE record (mostly T5).
- **Excluded:** utility models (U, Y), validations and translations of EP patents (T, T1–T4), and 1,057 applications that entered only through H10W/H10P and concern LEDs, solar cells or OLEDs (H10H, H10F, H10K without a device or quantum code).

- **Duplicates:** where an application had several publications on its first date, one record was kept.

Technology assignment

- 61 categories in 7 groups (transistors, materials, memory, processes, integration, design, quantum), each defined by CPC regular expressions and, where useful, English, German and French keywords in title and abstract. Keywords apply only within the matching CPC domain. Rules are stored in `patent_study.rules`.
- Basis recorded per assignment: of 29,738 assignments, 26,404 rest on CPC alone, 2,168 on CPC confirmed by text and 1,166 on text only (96% CPC-based). Seven categories are text-only (CFET, fan-out, trapped ion, neutral atom, photonic, topological, Ga2O3).
- **Full counting:** an application counts in every matching category. 579 applications fall into a domain but no specific category.
- Spot check (direct filings): a sample of text- and CPC-based assignments was read. One error was found and fixed: H10D30/47 also covers nanoribbon FETs, so HEMT was restricted to H10D30/471 ff. and H10D30/015.
- Trends use like-for-like windows: Nov 2024–Aug 2025 vs Nov 2025–Aug 2026.

Applicant grouping rules

- Starting point is Google's harmonised assignee name. 88 documented rules merge name variants and subsidiaries under a parent, for example all Infineon entities; Samsung Electronics + Display + Electro-Mechanics; LG Display + Electronics + Innotek; BOE and subsidiaries; Shin-Etsu Chemical + Shin-Etsu Handotai; Merck KGaA incl. Versum Materials; AMD incl. Xilinx; Adeia incl. Invensas and Xperi; Resonac incl. Showa Denko. Unmapped applicants keep their harmonised name.
- Co-applicants each receive full credit; totals by country and type count each application once.
- Type is rule-based on the name (company, university, research institute, individual or unclassified); CEA, CNRS, imec and Fraunhofer are set as research institutes. The Wikidata-verified types in the atlas cover direct filers only.

Origin rules

- **Applicant country** = country code of the first-named applicant on the patent record (`assignee_harmonized.country_code`); 241 records carry none. Group countries in the top-20 table are the parent's headquarters, so Infineon Austria counts as AT in section 7 and as part of the DE parent in section 5.
- **Priority office** = office prefix of the earliest-dated priority claim.

- **Inventor countries** from `inventor_harmonized`, fractional across inventors; known for 13,483 applications. For direct filings all publications of the application are used; for PCT-route additions the first European record.
- **Applicant locations** are verified per filing entity (PCT-route applicants added 8 Nov): Wikidata headquarters (P159 with coordinates), then the most frequent USPTO applicant address (PatentsView, re-geocoded against Overture Maps), then manual checks. Only exact and city-level locations are placed; nothing is placed at a national centroid, and private inventors stay at country level.

Deviations from the CN/TW study

1. Both studies now include PCT-route filings and report a PCT-excluded variant. Dating differs: CN counts the CN national-phase publication; here a Euro-PCT application counts at its first EP-office record (European-phase entry).
2. CPC only instead of CPC ∪ IPC, because European documents carry CPC.
3. 61 categories instead of 65; the taxonomies need a mapping for comparison.
4. Emerging-technology rule: ⩾ +40% and ⩾ 20 applications in the later window (CN/TW: ⩾ 40 CN, ⩾ 20 TW).
5. No extension domains (quantum communication and sensing, equipment).
6. Applicant locations verified per filing entity instead of inferred regions (all applicants, in the interactive atlas).
7. Title terms not used because of mixed-language titles.

Known gaps

- **Route dating:** Euro-PCT and direct filings published in the same window stem from different filing years (median Nov 2023 vs Sep 2024).
- **National coverage is uneven:** Italian data ends in December 2025, British data thins out in 2026, small offices are sparsely covered.
- **Verified types (Wikidata) cover only the largest groups; the city table in section 7f is computed on direct filings, while the interactive atlas covers the full** corpus.
- Text-only categories depend on keywords and probably undercount, especially for national filings in other languages.
- The window is by first publication, which lags filing by about 18 months (direct) or 31–34 months (PCT route).
- New applicants are new within the window only (no pre-2024 history).
- City-level applicant points are city centres; a company may have moved since its US patents were granted (up to 2021).

The final selection query:

```
CREATE OR REPLACE TABLE `patent-study-513418.patent_study.corpus2` AS
WITH g AS (
  SELECT application_number, MIN(publication_date) AS fpd,
    LOGICAL_OR(IFNULL(pct_number,'') != '') AS any_pct,
